

# MICROSOFT INTUNE AND AUTOPILOT DEPLOYMENT AND PROVISIONING

Connection's modernized deployment and provisioning service with Intune and Autopilot provides a comprehensive approach to managing and deploying Windows devices, from initial assessment and planning to deployment and ongoing support. Our team of certified professionals tailors the service to your needs, offering an end-to-end solution that enhances productivity and security. The service includes a centralized policy for device and application management, which is designed to keep your organization up to date—while mitigating unplanned downtime, reducing time-intensive IT operations, and increasing solution ROI. Connection's modernized deployment and provisioning service delivers a more robust and scalable IT landscape that supports your business objectives and drives innovation.

## Scope of Service

### Review and Design

Our team will review your device deployment and management strategy. Then we'll design the future state with a customized plan for configurations of policies, application, deployment, data management, software updates, and enrollment.

### Policy and Profile Configuration

Policies are configured in alignment with the plan established during the project's planning phase.

### Provision Windows Devices

Our Autopilot Configuration service includes creating both cloud-only and hybrid profiles, setting up Intune Connector Configuration Profiles, configuring the Enrollment Status Page, branding settings, and demonstrating how to add machines to the Autopilot Database.

### Intune Configuration

We assist with Intune configuration and device enrollment, ensuring streamlined updates and enhanced security for your IT landscape.

### Application Management

Our customized application management service encompasses the assignment of applications, device configurations, and compliance policies to your client devices or user groups, ensuring seamless integration and adherence to industry standards.

### Data Protection and Security

We configure compliance policies, conditional access policies, establish endpoint security policies, and configure policies to ensure that Windows updates are delivered to your devices and applied with access to reporting for continuity.

### Pilot

Connection's Pilot program ensures smooth deployment and configuration of devices by validating processes, addressing hardware and software issues, and collaborating with your IT Team. It involves creating end-user FAQs, developing a production deployment plan, and enrolling devices to verify MDM capabilities—ensuring a seamless transition to a sustainable, modernized approach to deployment and device provisioning.

### Additional Service Options

Intune provides mobile device management for Mac, iOS, and Android and offers many of the same features that Windows Device Management allows. We can integrate ABM and configure policies to provide Conditional Access and endpoint security, as well as provide application data management.
