

Windows Server End-of-Life Assessment

Life After End of Life

Are You Ready for Windows Server EOL?

It can be hard to figure out what to do with your end-of-life Windows servers. Should you upgrade them in place? Should you lift and shift to the cloud or migrate to a SaaS offering? Should you refactor or replace your applications? There is not one answer to this problem. In fact, there can be many options and the answer will be different on an application-by-application basis.

The Windows Server End-of-Life (EOL) Assessment service provides insight into your current Windows operating system environment. Windows Server operating systems, applications, and infrastructure services—such as DNS, DHCP, and AD—will be looked at during the engagement. The assessment provides strategic guidance for a successful Windows Server upgrade process while minimally impacting business functions.

Service Benefits

Understanding your environment and options is the first step in planning a successful migration off of an end-of-life environment. The output of the assessment includes a list of the applications and services discovered, an analysis of the data, a report showing the results, and recommendations on how to plan and prioritize the upgrade/migration process.

The results of the assessment will arm you with information about your environment and recommended migration options. This information will play a critical role as you develop and execute your migration plan.

Deliverables

The engagement deliverable package will include an executive summary, inventory of the environment, and recommended plan to update or migrate the in scope Windows Server roles and applications.
