Drawing from our complete line of products and services, we can customize solutions that address all the critical elements necessary for a successful deployment.

Logistics and Distribution

We can provide the logistics and staging needed for any deployment or relocation project. In addition to our warehousing abilities, we can distribute assets for end-users based on customer requirements to single or multiple locations including special events. We can also track new and decommissioned equipment.

Image Development and Deployment

No matter how many types of systems you are deploying, we will work with you to develop, maintain, and install your company images. As your IT environment becomes more complex with new hardware, applications, and the never-ending security patches and updates, we will work with you every step of the way to free up your internal IT staff and reduce deployment costs.

Configuration

Within our configuration centers we are capable of concurrently handling hundreds of systems; configuration can include installing hardware components, images, and asset tagging on newly deployed systems.

Migration

Whether it's an upgrade to a new operating system across your enterprise or migrating individual end-user data, we have the capabilities and best practices that minimize downtime and ensure end-user productivity while internal IT staffs focus on their daily workload.

Deployment, Installation, and Refresh

Whether it's a simple desk-side installation in a single location, a refresh and exchange for multiple users at a conference or event, or a rollout of equipment in multiple remote locations, we have the experience, technology, and processes for successful deployments. All components of this service are customizable to individual client requirements. This includes wall and ceiling installation of digital signage products.

Asset and Data Disposition

Properly disposing of obsolete equipment can be an ongoing challenge. Measures must be taken to protect sensitive data, comply with federal and local regulations, and reduce storage costs. Our programs can support collection, tracking, redeployment, and refurbishing your assets. In addition, we can ensure that any cash value your assets may hold at the time of disposition is realized to help defray the cost of your new equipment.
